

ABSTRACT OF THE DISCLOSURE

There is provided an image processing apparatus that is capable of protecting a received plurality of pieces of resource data against corruption. Print jobs transmitted from a plurality of information processing apparatuses are stored. When a download start request for resource data has been received by the communication device from one of the plurality of information processing apparatuses, it is determined whether a print job received by the communication device from one of a plurality of information processing apparatuses exists in the storage device. When the received print job exists in the storage device, the communication device is controlled to inform one of the plurality of information processing apparatuses that downloading of the resource data is not possible.
